APRIL[®] Unique Face Aging Software now on Internet
New version permits access from any computer

(Dublin, Ireland) – A new web-site – www.age-me.com – will offer the unique APRIL[®] facial age progression software on the Internet. The new version extends access to anyone who has a computer and access to the Internet. In addition, users will be able to use the web-site to perform as many or few agings as needed for a very low price.

Deirdre Hogan, Managing Director of Emege Imaging Inc., the company hosting the web-site says, “In the past, APRIL[®] has been available primarily to institutions and corporations due to its cost. Certainly, we are gratified that has found widespread use in anti-tobacco, healthy lifestyle, educational and business applications. Now, the Internet opens the APRIL[®] experience to anyone with Internet access – at a very reasonable price.”

APRIL[®] Age Progression Software is the only statistically-based age progression software now available. The software creates a stream of aged images of the face from a standard digital photograph. The wrinkling/aging algorithms are based upon research of more than 7,000 people of all ages, ethnicities and lifestyle habits, as well as on published data regarding facial changes associated with aging. Output images can be adjusted to compare how a person will age as a smoker verses a non-smoker, if he or she adds excessive weight or experiences a high degree of unprotected sun exposure.

About Emege Imaging Inc.

Founded in 2007, Emege operates the web-site that provides access to APRIL[®] Age Progression software developed by Aprilage Development Inc.

APRIL[®] Age Progression Software has been developed by Aprilage Development Inc. in association with the Ontario Science Centre. The software is used in more than a dozen countries for health and science education, entertainment and product marketing.
