Aprilage Development Announces Further improvements to its Face Aging Software

Latest Version of Software includes further image additions to its Hispanic and South Asian data sets and improved resolution

(Toronto, Canada) – Aprilage Development Inc. announces the immediate release of the newest version of its unique age progression software. The version 2.6 has further additions to its Hispanic and South Asian data sets as well as enhanced image quality.

Aprilage’s President Ron Estey says, “In our quest to offer ongoing improvements to this unique software, we continue to improve and refine its aging algorithms and data processes. The addition of further data further enhances the software’s quality as well as providing more detail in each aging offering its users improved output resolution.

APRIL® Age Progression Software is the only statistically based age progression software now available. The software creates a stream of aged images of faces from a standard digital photograph. The wrinkling/aging algorithms are based upon research of more than 7,000 people of all ages, ethnicities and lifestyle habits, as well as on published data regarding facial changes associated with aging. Output images can be adjusted to compare how a person will age as a smoker versus a non-smoker, if he or she adds excessive weight or experiences a high degree of unprotected sun exposure.

About Aprilage Development Inc.

Founded in 1998, Aprilage Development Inc. has developed APRIL® Age Progression Software in association with the Ontario Science Centre and with the support of the National Research Council of Canada. The software is used in more than a dozen countries for health and science education, entertainment and product marketing.
